Von Aedon Davis : A Presidential Energy Policy: Twenty-five Points Addressing the Siamese Twins of Energy and Money before purchasing it in order to gage whether or not it would be worth my time, and all praised A Presidential Energy Policy: Twenty-five Points Addressing the Siamese Twins of Energy and Money:

KundenrezensionenHilfreichste Kundenrezensionen3 von 3 Kunden fanden die folgende Rezension hilfreich. Time

past noon Von A. Schmidt Mike Ruppert's new book is a cold blooded, realistic stocktaking of our planet's energy resources and the resulting consequences. It is not written to comfort the reader, it is written to finally wake him up. Our time is ticking away as all of our fossil energy resources dwindle with increasing speed. In his own analytic, brilliant style he unmasks the lies and childish naivety of our political leaders about new and alternative energy. He addresses the symbiosis of energy and money and there is no misunderstanding his point. After the energy check up is complete, Ruppert does not leave the desperate reader on his own, instead he lists 25 points of things immediately to be done by the current US president, though most of these things should have been done 30 years ago. This book leaves no doubt of our current position as a species: We are just facing the end of industrial civilization, with a disastrous impact in every aspect of our daily lives. Only immediate action and thoughtful policy is going to prevent the possible extinction of our species in the very near future. First thing on the list is to get rid of our current political leaders and any establishment influence in politics, as their way of not solving anything is leading directly into the abyss of planetary history. As "The Eagles" get it in their new song "Long road out of Eden": "All the knowledge of the world is of no use to fools!" Yes indeed, that is the heart of the matter. Though this book is written for the current US President, in my opinion it is a must read for every intelligent being on earth, because it is the handbook for survival of humankind in preparation for the post-carbon age. Hopefully this book comes out in every major language, it really matters.

Kurzbeschreibung Michael Ruppert addresses some simple but widely ignored concepts relating to the critical role of oil and gas in the modern world. First, they are finite resources, formed in the geological past, therefore subject to depletion. Second, they have to be found before they can be produced. He then goes on to address the wider implications recognizing that there is a finite Oil Age. Many claims have been made that new technology will counter the natural decline, but there is an irony: the better the technology, the faster the depletion. The book then turns to related subjects, including foreign policy and the invasion of Iraq, the hopes for renewable energy substitutes, the impact on farming and population, and the nature of Money. The impact on the economy is a central theme of the book. It gives emphasis to the U.S. situation but also covers the wider World, ending with twenty-five sensible recommendations by which the United States Government could react to the unfolding situation.
